

PERFORMANCE UPDATE ON BAYER SEED TREATMENT
PORTFOLIO FROM 2017

Nick Tinsley¹

Many soybean producers throughout the north-central United States faced challenging environmental conditions during and after planting activities in 2017. The cooler and wetter conditions experienced by many this spring increased the likelihood of experiencing a number of seedling diseases. In addition to other management practices, such diseases can be managed through the wise selection of appropriate seed treatments. A research update from 2017 related to the performance of Bayer's SeedGrowth portfolio will be shared with an emphasis on how seed treatments can reduce risk exposure and mitigate yield loss.
