

## THE ANATOMY OF GRAIN DUST EXPLOSION AND HOW TO AVOID IT

Bruce McLelland<sup>1/</sup>

Grain dust explosions can and must be prevented by engaging in safe handling and processing practices as identified in NFPA 61 and NFPA 652. Prevention and mitigation of fire, flash fire, and deflagration are essential to life safety and property protection and at the same time can create production efficiencies. This session will cover examples of loss, recommendations for prevention, as well as responsive protective measures that can be implemented in simple handling as well as complex processing.
